

# The TREC Conferences: An Introduction

Ellen Voorhees  
**NIST**

**National Institute of Standards and Technology**  
Technology Administration, U.S. Department of Commerce

*Text REtrieval Conference (TREC)*

# Talk Outline

- General introduction to TREC
  - TREC history
  - TREC impacts
- Cranfield tradition of laboratory tests
  - mechanics of building test collections
  - test collection quality
  - legitimate uses of test collections
- IR evaluation primer

# What is TREC?

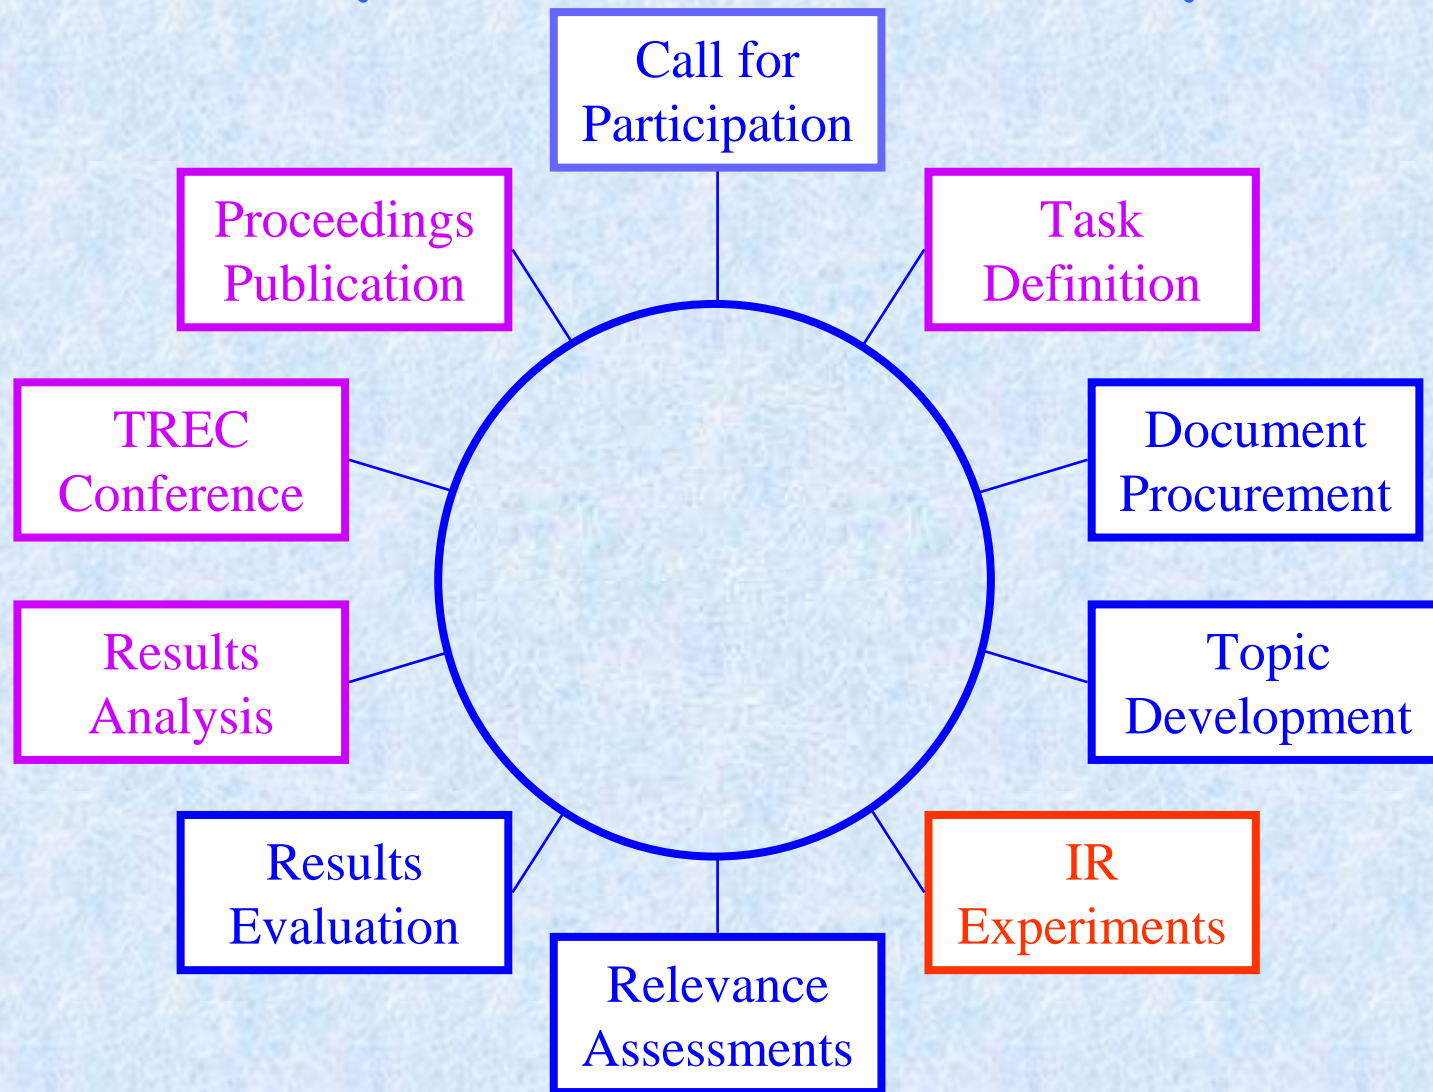

- A workshop series that provides the infrastructure for large-scale testing of (text) retrieval technology
  - realistic test collections
  - uniform, appropriate scoring procedures
  - a forum for the exchange of research ideas and for the discussion of research methodology

# TREC Philosophy

- TREC is a modern example of the Cranfield tradition
  - system evaluation based on test collections
- Emphasis on advancing the state of the art from evaluation results
  - TREC's primary purpose is not competitive benchmarking
  - experimental workshop: sometimes experiments fail!

# Yearly Conference Cycle

# TREC 2003 Track Coordinators

Genomics: Bill Hersh

HARD: James Allan

Novelty: Ian Soboroff, Donna Harman

Question Answering: Ellen Voorhees

Robust Retrieval: Ellen Voorhees

Web: David Hawking, Nick Craswell, Ian Soboroff

# A Brief History of TREC

- 1992: first TREC conference
  - started by Donna Harman and Charles Wayne as 1 of 3 evaluations in DARPA's TIPSTER program
  - first 3 CDs of documents from this era, hence known as the "TIPSTER" CDs
  - open to IR groups not funded by DARPA
    - 25 groups submitted runs
  - two tasks: ad hoc retrieval, routing
    - 2GB of text, 50 topics
    - primarily an exercise in scaling up systems

# A Brief History of TREC

- 1993 (TREC-2)
  - true baseline performance for main tasks
- 1994 (TREC-3)
  - initial exploration of additional tasks in TREC
- 1995 (TREC-4)
  - official beginning of TREC track structure
- 1998 (TREC-7)
  - routing dropped as a main task, though incorporated into filtering track
- 2000 (TREC-9)
  - ad hoc main task dropped; first all-track TREC

# TREC Tracks

*Text REtrieval Conference (TREC)*

# TREC Tracks

- Task that focuses on a particular subproblem of text retrieval
- Tracks invigorate TREC & keep TREC ahead of the state-of-the-art
  - specialized collections support research in new areas
  - first large-scale experiments debug what the task really is
  - provide evidence of technology's robustness

# TREC Tracks

- Set of tracks in a particular TREC depends on:
  - interests of participants
  - appropriateness of task to TREC
  - needs of sponsors
  - resource constraints
- Need to submit proposal for new track in writing to NIST by November 1

# TREC Impacts

- Test collections
- Incubator for new research areas
- Common evaluation methodology and improved measures for text retrieval
- Open forum for exchange of research
- Technology transfer

# TREC Impacts

# Ad Hoc Technologies

	TREC-2	TREC-3	TREC-4	TREC-5	TREC-6	TREC-7
Term weights	baseline start of Okapi wts	Okapi perfects “BM25” algorithm	new wts for SMART, INQUERY, PIRCS	Okapi/ SMART wts used by others	adaptations of Okapi/SMART algorithm in most systems	new Twente and BBN models
Passages	use of subdocs by PIRCS	heavy use of passages/ subdocs	decline in use of passages		use of passages in relevance feedback	multiple uses of passages
Auto query expansion		start of expansion using top X documents	heavy use of expansion using top X documents	start of more complex expansion	more sophisticated expansion experiments by many groups	
Manual query mods		manual expansion using other sources	experiments in manual editing/user- in-the-loop	extensive user-in-the- loop experiments	simpler user-specific strategies tested	
Other new areas		initial use of data fusion		start of concentration on initial topic	more complex use of data fusion  continued focus on initial topic, especially the title	

# Talk Outline

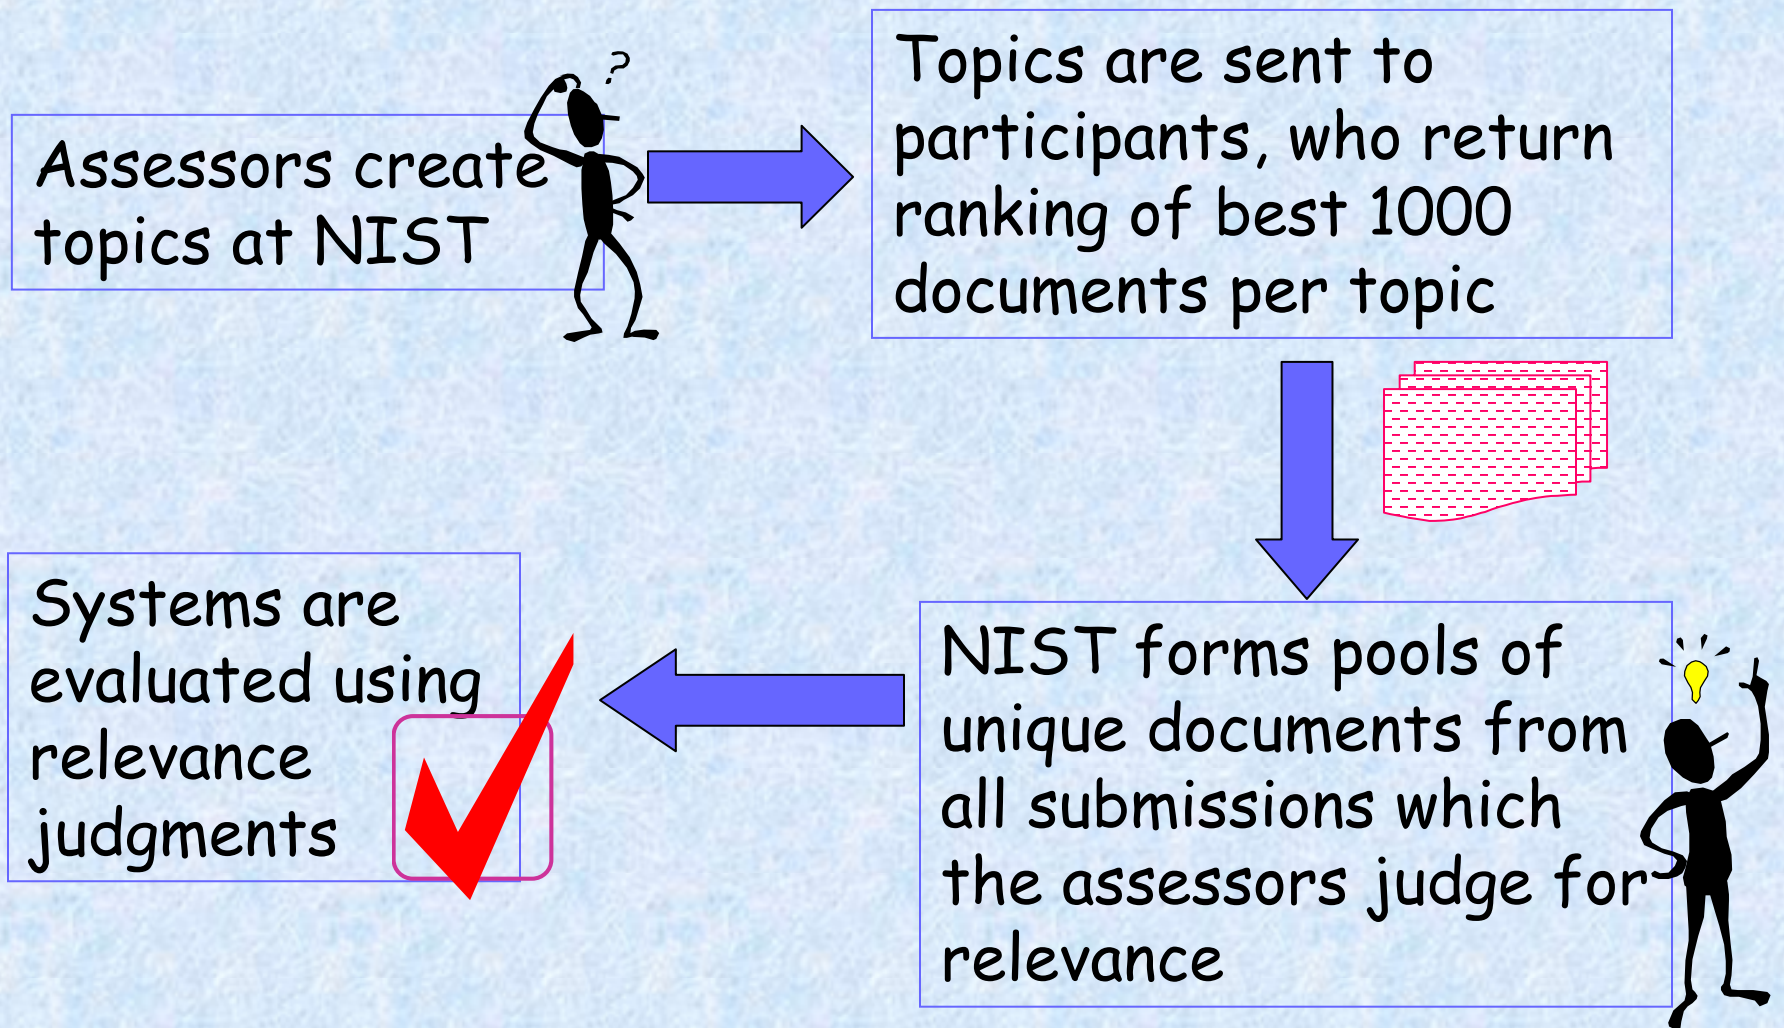

- General introduction to TREC
  - TREC history
  - TREC impacts
- ➡ Cranfield tradition of laboratory tests
  - mechanics of building test collections
  - test collection quality
  - legitimate uses of test collections
- IR evaluation primer

# Cranfield Tradition

- Laboratory testing of system components
  - fine control over variables
  - abstraction from operational setting
  - comparative testing
- Test collections
  - set of documents
  - set of questions
  - relevance judgments

# TREC approach

*Text REtrieval Conference (TREC)*

# Creating a test collection for an ad hoc task

topic statements

Automatic: no manual intervention

Manual: everything else, including interactive feedback

queries

representative document set

ranked list

# Creating Relevance Judgments

# Documents

- Must be representative of real task of interest
  - genre
  - diversity (subjects, style, vocabulary)
  - amount
  - full text vs. abstract
- TREC
  - generally newswire/newspaper
  - general interest topics
  - fulltext

# Topics

- Distinguish between stmt of user need (topic) & system data structure (query)
  - topic gives criteria for relevance
  - allows for different query construction techniques
- TREC topics are NOT all created equal
  - 1-150: very detailed, rich content
  - 151-200: method of topic creation resulted in focused, easy topics
  - 201-250: single sentence only
  - 301-450: title is set of hand-picked keywords

# Relevance Judgments

- Main source of criticism of Cranfield tradition
  - In test collections, judgments are usually binary, static, and assumed to be complete.
  - But...
    - "relevance" is highly idiosyncratic
    - relevance does not entail utility
    - documents have different degrees of relevance
    - relevance can change over time for the same user
    - for realistic collections, judgments cannot be complete

# Relevance Judgments

- Consistency
  - idiosyncratic nature of relevance judgments does not affect comparative results
- Incompleteness
  - the important issue is that relevant judgments be unbiased
    - complete judgments must be unbiased
  - TREC pooling has been adequate to produce unbiased judgments

# Consistency

- Mean Kendall  $\tau$  between system rankings produced from different qrel sets: .938
- Similar results held for
  - different query sets
  - different evaluation measures
  - different assessor types
  - single opinion vs. group opinion judgments

# Average Precision by Qrel

# QA Judgments

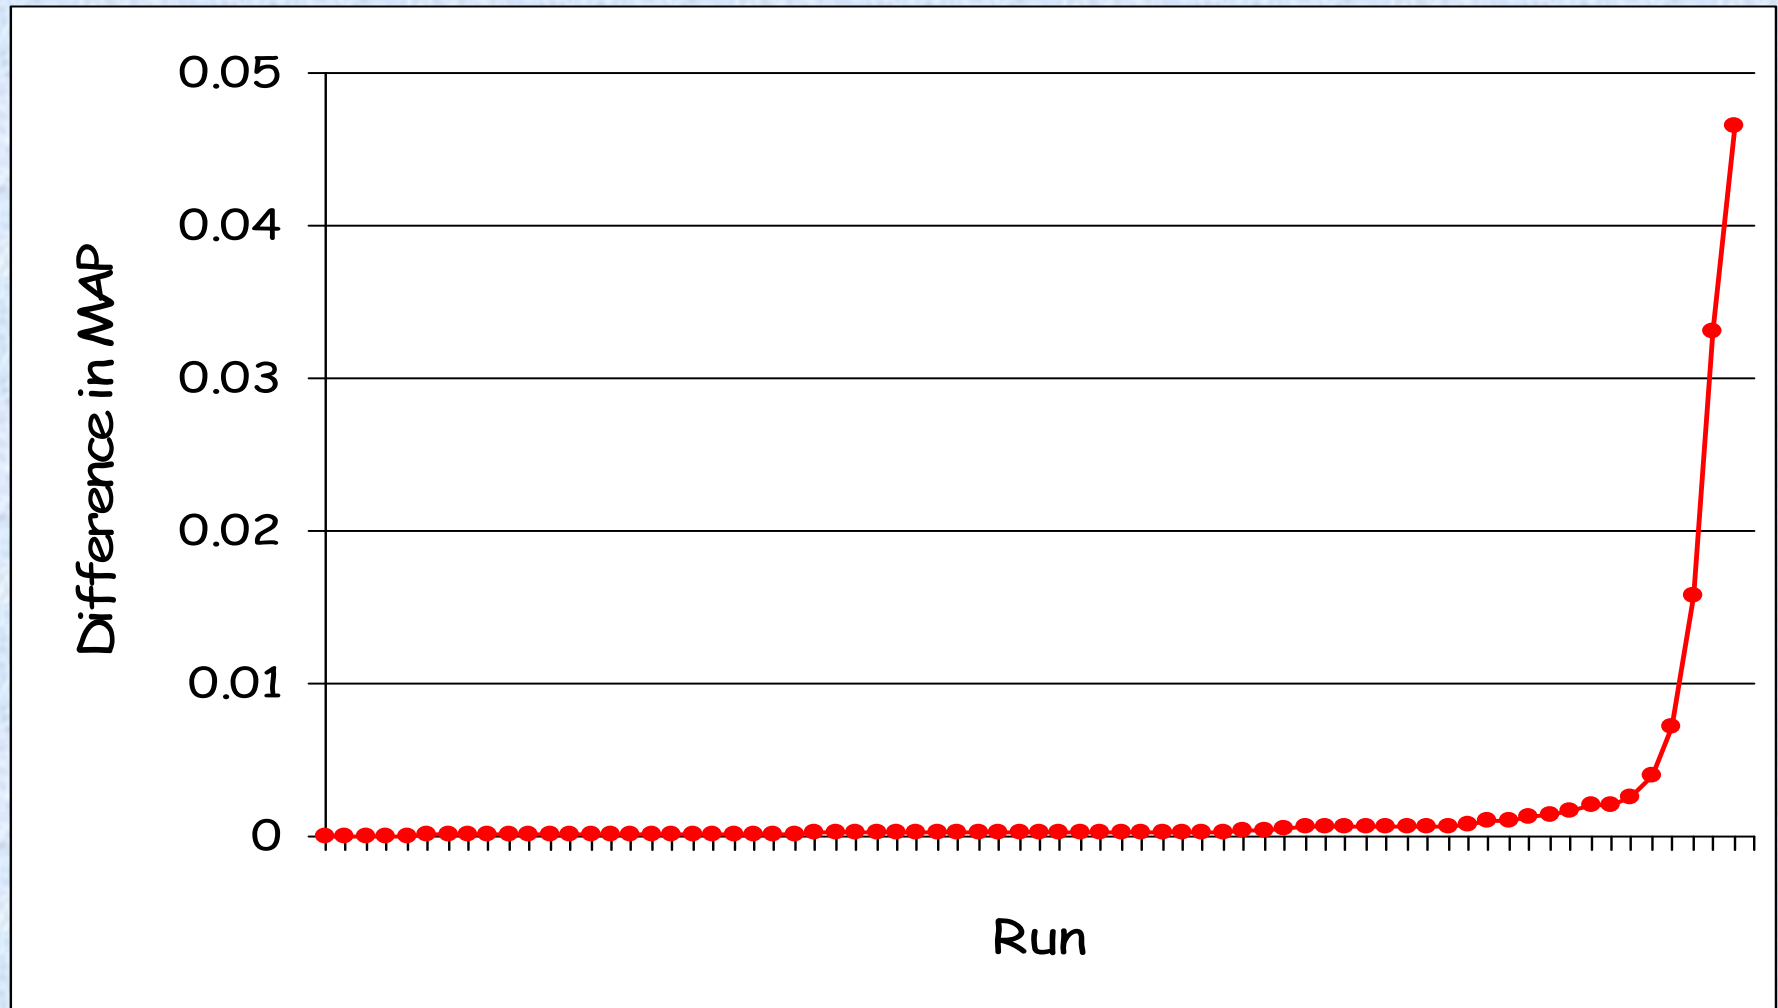

- Judging correctness, not relevance
- Assessors have differences of opinions as to what constitutes a correct answer
  - granularity of names, dates
  - assumed context
- Comparative evaluation stable despite those differences

# Incompleteness

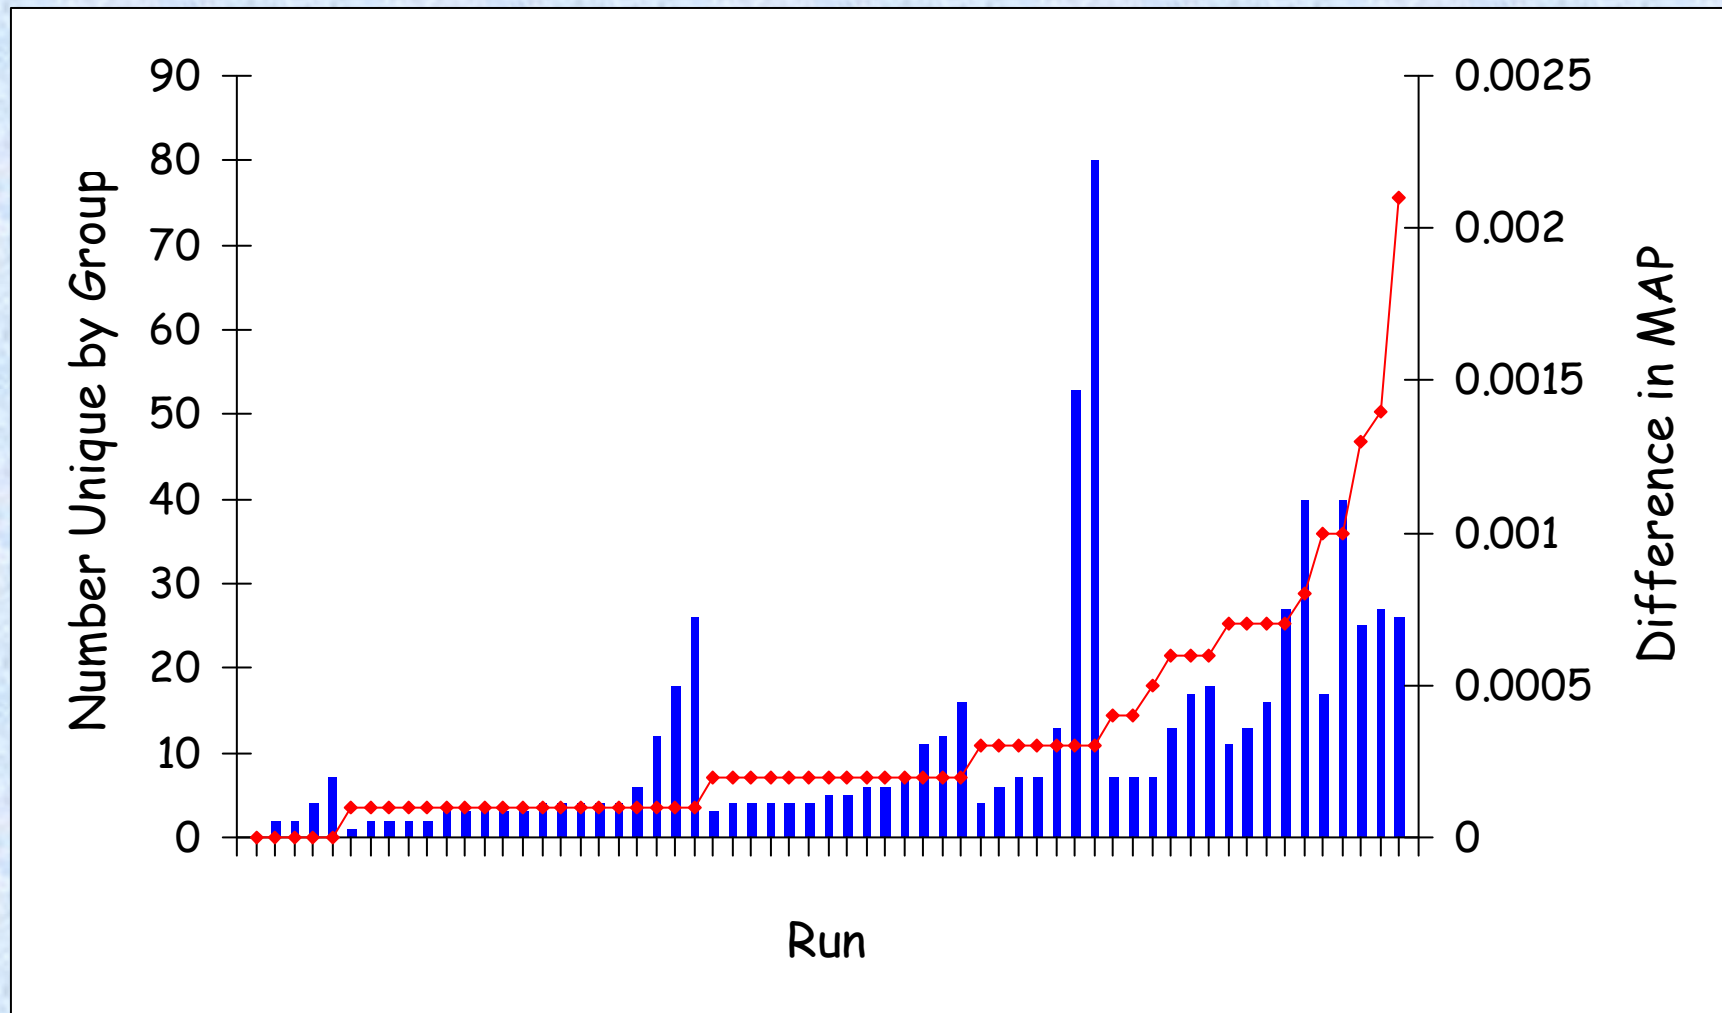

- Study by Zobel [SIGIR-98]:
  - Quality of relevance judgments does depend on pool depth and diversity
  - TREC ad hoc collections not biased against systems that do not contribute to the pools
  - TREC judgments not complete
    - additional relevant documents distributed roughly uniformly across systems but highly skewed across topics

# Uniques Effect on Evaluation

# Uniques Effect on Evaluation: Automatic Only

# Cranfield Tradition

- Test collections are abstractions, but laboratory tests are useful nonetheless
  - evaluation technology is predictive (i.e., results transfer to operational settings)
  - different relevance judgments almost always produce the same comparative results
  - adequate pools allow unbiased evaluation of unjudged runs

# Cranfield Tradition

- Note the emphasis on *comparative* !!
  - absolute value of effectiveness measures not meaningful
    - absolute value changes as relevance judgments change
    - theoretical maximum of 1.0 for both recall and precision not obtainable by humans (inter-assessor judgments suggest 65% precision at 65% recall)
  - evaluation results are only comparable when they are from the same collection
    - a subset of a collection is a different collection
    - comparisons between different TREC collections are invalid

# Talk Outline

- General introduction to TREC
  - TREC history
  - TREC impacts
- Cranfield tradition of laboratory tests
  - mechanics of building test collections
  - test collection quality
  - legitimate uses of test collections

➡ IR evaluation primer

# trec\_eval Evaluation Report

Ad hoc results — Cornell University

Summary Statistics	
Run Number	Cor6A3cdl
Run Description	Category A, Automatic, long
Number of Topics	50
Total number of documents over all topics	
Retrieved:	50000
Relevant:	4611
Rel-ret:	2590

Recall Level Precision Averages	
Recall	Precision
0.00	0.7013
0.10	0.5050
0.20	0.4150
0.30	0.2846
0.40	0.2187
0.50	0.1775
0.60	0.1402
0.70	0.1015
0.80	0.0538
0.90	0.0224
1.00	0.0091
Average precision over all relevant docs	
non-interpolated	0.2139

Document Level Averages	
	Precision
At 5 docs	0.4480
At 10 docs	0.4260
At 15 docs	0.4013
At 20 docs	0.3630
At 30 docs	0.3200
At 100 docs	0.2010
At 200 docs	0.1418
At 500 docs	0.0823
At 1000 docs	0.0518
R-Precision (precision after R docs retrieved (where R is the number of relevant documents))	
Exact	0.2415

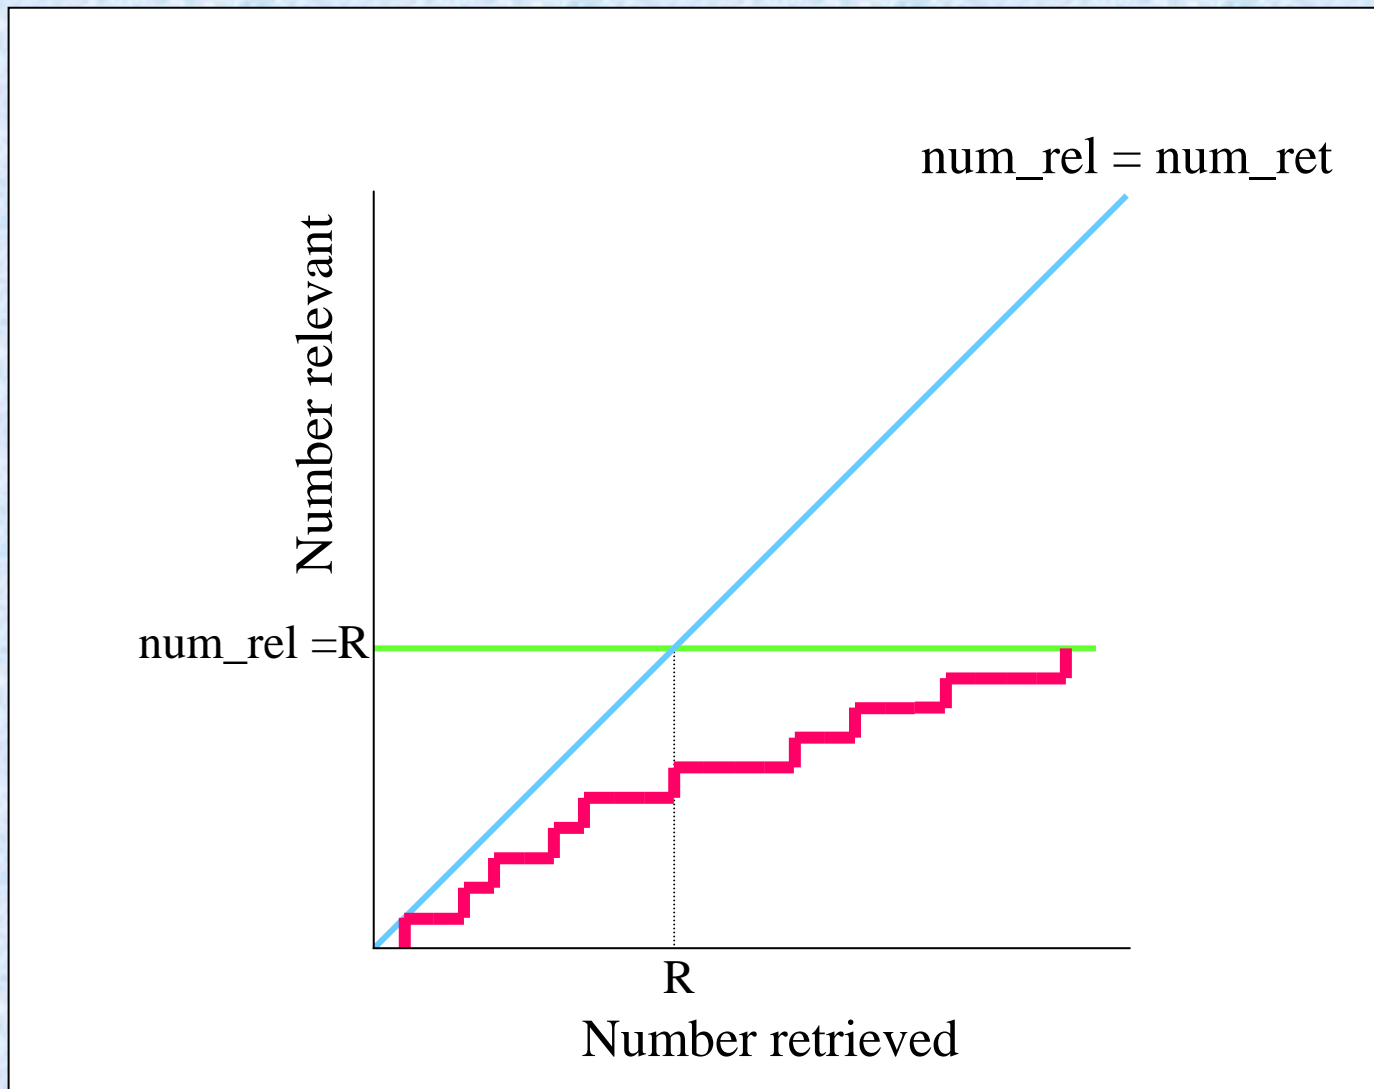

# Evaluation Measure Criteria

- Related to a user satisfaction
- Interpretable
- Able to average or collect
- Have high discrimination power
- Able to be analyzed

# Ranked Retrieval Chart

# Evaluation Contingency Table

	Relevant	Non-Relevant
Retrieved	$r$	$n-r$
Non-Retrieved	$R-r$	$N-n-R+r$

$N$  = number docs in collection

$n$  = number docs retrieved

$R$  = number relevant docs

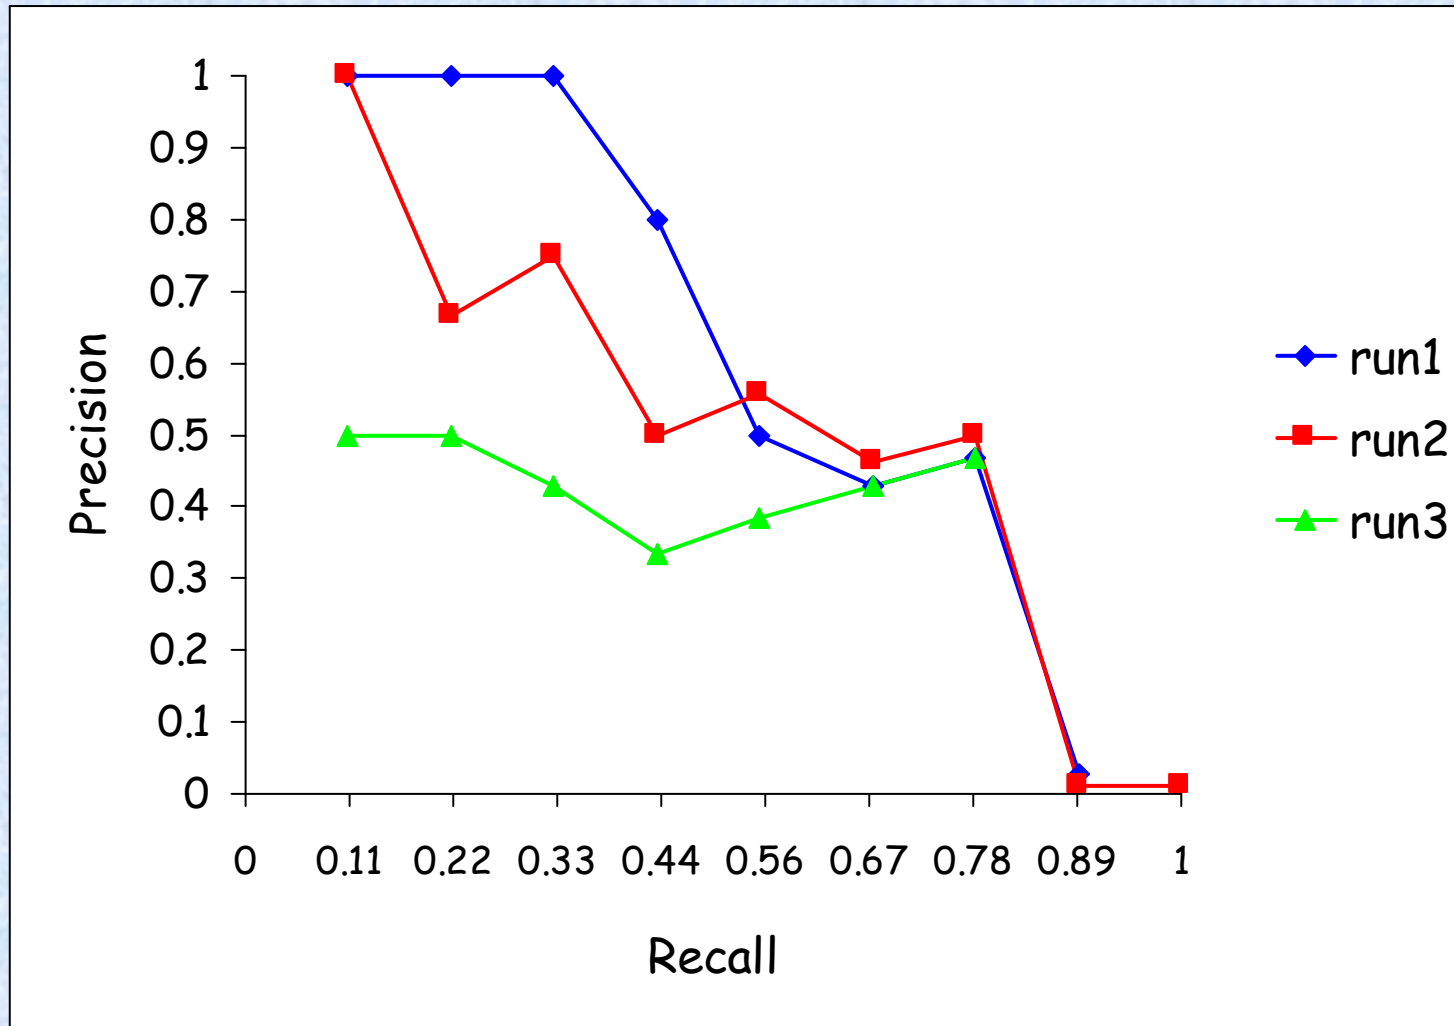

$r$  = number relevant retrieved

# Recall-Precision Graph

# Uninterpolated R-P Curve for Single topic

# Interpolated R-P Curves for Individual Topics

# Single Number Summary Scores

- Precision (n):  $r / n$
- Recall(n):  $r / R$
- Average precision:  $\text{Avg}_{rd} (\text{Prec}(\text{rank of } rd))$
- R-Precision:  $\text{Prec}(R)$
- Recall at .5 precision
  - use  $\text{Prec}(10)$  if precision  $< .5$  in top 10
- Rank of first relevant (expected search length)

# Document Level Measures

- Advantage
  - immediately interpretable
- Disadvantages
  - don't average well
    - different number of relevant implies topics are in different parts of recall-precision curve
    - theoretical maximums impossible to reach
  - insensitive to ranking: only # rels that cross cut-off affect ranking
    - less useful for tuning a system

# Number Relevant

# Average Precision

- Advantages
  - sensitive to entire ranking: changing a single rank will change final score
  - stable: a small change in ranking makes a relatively small change in score
  - has both precision- and recall-oriented factors
    - ranks closest to 1 receive largest weight
    - computed over all relevant documents
- Disadvantages
  - less easily interpreted

# Correlations Between Rankings

	P(30)	R Prec	Ave Prec	Recall at .5 P	Recall (1000)	Total Rels	Rank 1 <sup>st</sup> Rel
P(10)	.8851	.8151	.7899	.7855	.7817	.7718	.6378
P(30)		.8676	.8446	.8238	.7959	.7915	.6213
R Prec			.9245	.8654	.8342	.8320	.5896
Ave Prec				.8840	.8473	.8495	.5612
R at .5 P					.7707	.7762	.5349
Recall(1000)						.9212	.5891
Total Rels							.5880

Kendall's  $\tau$  computed between pairs of rankings

# Good Experimental Design

- Three factors that can be manipulated to increase confidence in results
  - number of topics
  - evaluation measure used
  - the  $\Delta$  used to consider runs "different"
- <sup>1</sup>  $\Delta$  bigger than community generally using!
  - empirical investigation of past TREC results shows that with 50 topics a 5% error rate is reached with an absolute difference in MAP scores of .05
    - approximately a 15% relative difference for good runs
  - confidence can be increased by repeating experiment on multiple collections

# Known Item Search Evaluation

- Known item search: find document known to exist in collection
  - named page finding in web track
- Rewarded for retrieving particular target only, not related documents

# Known Item Search Evaluation

- Mean reciprocal rank
  - use of reciprocal bounds measure & emphasizes differences that matter
  - equivalent to average precision with 1 rel
  - sensitivity of measure depends on size of ranked list
- Other statistics reported:
  - number of times target in first rank
  - number of times target not retrieved at all

# Set-based Evaluation

- Required for some tasks
  - traditional Boolean searches
  - filtering
  - novelty
- 2 main approaches
  - utility functions
  - combinations of recall & precision
    - $F(\beta) = [(\beta^2+1) \times P \times R] / (\beta^2 P + R)$

# Summary

- TREC emphasizes individual experiments evaluated on a benchmark task
  - leverages modest government investment into substantially more R&D than could be funded directly
  - improves state-of-the-art
  - accelerates technology transfer
